EDUCATION

Imperial College London	Sept 2023 - Jun 2027
MEng Computing, currently in 4th year. Achieved Dean's List in Year 1 and 3, First Class in Year 1-3.	
Studied, among other modules, Software Engineering Design, Deep Learning, Computational Techniques, Compilers, Algorithm Design and Analysis + Data Structures, Natural Language Processing, Comp. Vision.	
Newcastle Royal Grammar School	Sept 2016 – Jun 2023
Advanced Level (A Levels) - A* in all subjects (Maths, Further Maths, Physics and Computer Science)	

EXPERIENCE

Co-Founded LineupsValorant	Jan 2021 - present
Co-founded and grew LineupsValorant , a website to help Valorant players find strategies, to more than 70 000 monthly active users, gaining skills in web development, securing apps and growing a business.	
Tech Intern at Optiver	Apr 2026 - Sep 2026
- Designed a mass migration platform to make audited deterministic changes to >7000 repositories safely. - Setup ingestion for multiple external datasets and improved upon the internal ingestion framework to improve scalability and maintainability, delivering a \$1 million+ upside per year. - Took ownership of blockers and areas of improvement outside the immediate domain of my projects.	
Software Engineering Intern at theTradeDesk	Jun 2025 - Sep 2025
- Created a notification service for developers that directly addressed common complaints, allowing them to receive updates on internal tooling and alert teammates about actions requiring their review. - Among other Agile techniques, participated in twice-weekly stand-ups, discussed with teams for other uses of the project and clearly documented work and progress to ensure that the project was shipped on time.	
Software Developer at Newcastle University	Dec 2021 - Sep 2024
Collected requirements and led development of software to aid studies at the university, increasing patient participation and engagement. Primarily created with AWS EC2, BLE devices and Flask.	

PROJECTS AND ACHIEVEMENTS

LineupsValorant Computer Vision Location Classification	July 2026
Built and trained a lightweight CNN classifier to process frames from Valorant and detect where players are standing to show relevant lineups nearby, using Pytorch, onnx JS runtime and LLM assisted dataset labelling.	
Orchestrating Agent Harness	Sep 2026
Small project for an agent harness to oversee coding agent sessions and run routine tasks with global context.	
Imperial Kotlin AI Pawn Race 4th Place	Dec 2023
Developed an AI bot to participate in a modified pawn race, requiring identification and self-learning of relevant AI techniques. Used minimax algorithm with alpha-beta pruning to achieve a performant bot.	
PintOS Mini Operating System	Sep 2024 - Dec 2024
Worked on a skeleton OS called PintOS, integrating MLFQ scheduling, user programs and virtual memory.	
WACC Compiler	Jan 2025 - Mar 2025
- Designed and built a compiler from scratch for a basic C-like programming language called WACC. - Implemented using Scala and Parsley, a parser combinator library. - Architected an object oriented extension to the language, including basic inheritance with sub-classing.	
First and Third Year Computing Dean's List	Sep 2023 - Jun 2024
Won the Dean's List prize twice for students who achieve a first and are in the top 10% of the year group.	

SKILLS

Languages	Java, C#, C, Python, Scala, Kotlin, TypeScript/JavaScript, HTML/CSS
Technologies	Git, SQL/SQLite/PostgreSQL, MartenDB, AWS EC2, React, Vercel, Next.js, Flask, GraphQL
